

The following issues have been resolved in CT Summation Enterprise, version 2.7.

Core Database

- CT Summation Enterprise, when the **Prompt to Save Record** database default option is not selected, automatically saves changes made to a database summary before the summary is tagged from **Tag** view.

DII File Loading

- CT Summation Enterprise successfully loads DII files containing date values using the DD/MM/YYYY format.
- CT Summation Enterprise properly retains the data for whichever field is mapped to **Related Document IDs (Link Fields** tab on the **Defaults** dialog box).
- CT Summation Enterprise leaves DII file fields exceeding maximum size unpopulated, and then logs the error in an error log.

Form Editor

- CT Summation Enterprise properly opens the Form Editor when working with cases migrated from CT Summation LG/iBlaze.
- CT Summation Enterprise leaves original forms unchanged while saving any modifications made to the originals to the forms specified when the **Save As** option is selected from the Form Editor **File** menu.
- CT Summation Enterprise allows users to remove the **Folder** field from a form without affecting the **Folders** component in **Case Explorer** and/or **Tag** view.
- CT Summation Enterprise performs as expected when scrolling in or deleting tables from the **Alter Table** dialog box in the Form Editor.

Imaging

- CT Summation Enterprise properly resizes the redaction text when an image redaction is resized.
- CT Summation Enterprise allows users to create or select a redaction within an image file and navigate to the previous or next page or image file without first releasing the mouse.
- CT Summation Enterprise properly saves changes made to the redaction text on an image.

Production Tools

- CT Summation Enterprise no longer stops a **Briefcase** or **Production Briefcase** if an “Error 429” occurs. If the error occurs, the briefcase is completed, and the error is recorded in the error log.
- CT Summation Enterprise now detects and logs an error if a failure is detected when saving images and/or image markups in a briefcase.

Tagging and Foldering

- CT Summation Enterprise now disables the **Display <column name> in Tag View** option (available by right-clicking a column header) if a column's lookup table attribute includes one or more **Fill-In Another Field** assignments.

WebBlaze

- CT Summation WebBlaze successfully saves changes made when selecting or reordering Core Database field columns for display.
- CT Summation WebBlaze properly displays the **Docid** in search results found after performing a query for **Docid** (for example, *Docid = *_X*).

- CT Summation WebBlaze displays image redactions created in CT Summation Enterprise as view-only.
- CT Summation WebBlaze fully supports cases having a CT Summation Enterprise Case Information (.sseci) file path mapped to a location other than the default **SSE\Cases** folder.
