

The 2.9.1.7 **HOT FIX** provides the following issue resolutions:

- Only petrified emails (image files) in a production set are available for viewing when a briefcase is created using the **Petrified** option.
- The **Check Attachment Links** function retains unrelated records and displays an error message if an attachment referred to in the **Attachment Doc IDs** field does not exist in the database.
- PST files are loaded successfully, and emails and their attached messages (MSG files) are processed properly when loading email using the **Process Attached MSG Files** option. In addition, these files are copied appropriately when they are included in a briefcase.
